

Note!

Components:

- Tip your nuts, bolts and caps into one of the seed trays.
- Throughout initial assembly the nuts and bolts need only be **finger tight**. The structure will be squared out on a level floor later on.
- In this model the nuts need to face **away** from the frame to allow for the black caps to be inserted in the final stages.

1

- Layout the four **legs**.
- Join each pair together with the '**Long Horizontal**' parts to form the two main frame sections of the overall frame.

2

- Place one of the main frame sections up against a wall (for stability) and attach the '**Short horizontal**' parts. It will be unstable at this stage due to the un-tightened nuts and bolts.
- Attach the other **main frame** in a similar manner forming the cage.

3

- Stand the frame on a level floor so the frame is square when the nuts are tightened.
- **Tighten-up** each nut and bolt ensuring that both the long and short horizontals butt up against the leg. This creates a tight fit for each tray in the frame. Make the horizontals **flush** at the top for a **neat smooth** finish.
- Check that the frame is **square**, diagonal measurements should be **equal**. Adjust if necessary.
- Push the '**black caps**' onto each nut.

4

- **Move** the frame into situ.
- **Insert** trays.
